

(Source : <https://vuetifyjs.com/en/getting-started/installation/#vue-cli-install>)

Now that you have an instantiated project, you can add the Vuetify [Vue CLI package](#) using the cli.

```
vue add vuetify
```

This command will make changes to your project template files, components folder, vue.config.js, etc. If you are installing Vuetify via Vue-CLI, make sure you commit your code to avoid any potential data loss. Template changes can be skipped by selecting the advanced install option during install.

Vue UI install

Vuetify can also be installed using **Vue UI**, the new visual application for Vue CLI. Ensure that you have the latest version of Vue CLI installed, then from your terminal type:

```
# ensure Vue CLI is >= 3.0
```

```
vue --version
```

```
# Then start the UI
```

```
vue ui
```

This will start the Vue User Interface and open a new window in your browser. On the left side of your screen, click on **Plugins**. Once there, search for Vuetify in the input field and install the plugin.

Install Vuetify Plugin
